Provider HCC Risk Adjusted Diagnoses

This reference is intended to provide the most frequent risk adjustable ICD-10-CM diagnosis codes for conditions used in the inpatient and outpatient settings. Please consider that most of the acute condition codes (designated with red type) should not be documented in the outpatient setting, but are more appropriate for the inpatient setting. It does not define a standard of care and should not substitute for an informed medical evaluation, or diagnosis and treatment performed by a licensed healthcare provider. HealthCare Partners, IPA does not warrant nor represent that the information contained herein is accurate or free from defects.

Making Sense of ICD-10-CM

ICD-10 alphanumeric, each diagnosis consisting of 3-7 characters

- 1ST character is always a letter indicating organ/body system
- 2ND character is always numeric and refines the category
- 3RD - 6TH characters can be alpha or numeric, and indicate etiology/cause, anatomic location, disease/status severity
- 7TH character may be required for injuries and OB

For example:

I69.242 Monoplegia of lower limb following other nontraumatic intracranial hemorrhage affecting left dominant side

Note #1: Acute care, hospital inpatient codes are designated in red. Most of the codes are not appropriate to document as active/current conditions in the outpatient setting.

Note #2: New HCC diagnosis codes have been added to the CMS-HCC V28 model for PY 2023/2024.
